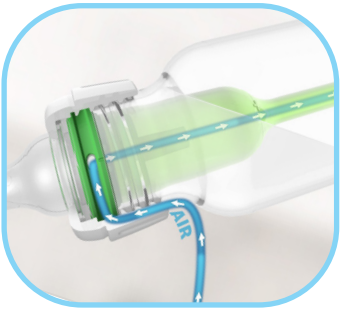
Dr Brown's Medical

Zero-Resistance™ Bottle System

HOW IT WORKS

1. Air enters under the collar at the top of the internal vent system.



2. Air flows to the bottom of the bottle through the reservoir (the tube-like section of the internal vent system) exchanging liquid with air.

3. This exchange maintains a positive pressure resulting in:
   - Reduced Energy Expenditure
   - Increased Feeding Efficiency
   - Improved Physiological Stability
   - No Nipple Collapse
